QUESTION 1

The Road Traffic Inspectorate is doing research on the legibility distance, i.e. the maximum distance at which the driver of a vehicle can read a road sign. For their research they tested 12 drivers of different ages to determine their legibility distances. They hope to improve road safety by examining the relationship between age (x) measured in years and legibility distance (y) measured in metres. The table below lists the data obtained in this way.

Age of driver in years (x)	19	24	28	29	32	35	49	55	63	74	79	82
Legibility distance in metres (y)	155	149	155	131	128	137	136	128	110	109	94	90

- 1.1 Determine the equation of the least squares regression line for the data. (3)
- 1.2 Write down the correlation coefficient. (1)

QUESTION 2

A farmer germinated 200 seeds of a rare and valuable tree species and planted the seedlings in pots. The pots were placed in a greenhouse where they would grow faster than outside. After one year, the heights of the trees in the pots were measured and an ogive was drawn. The shortest tree was 41 cm high and the tallest tree 88 cm.

- 2.1 Draw a box and whisker diagram of the heights of the trees after one year, using the number line provided in the ANSWER BOOK. (3)
- 2.2 Describe the skewness of the data set. (1)
- 2.3 The trees can be sold as soon as they have reached a height of 75 cm. Will the farmer be able to sell more trees in the short term if the data set is skewed to the left or to the right? (1)
- 2.4 The farmer selected 14 of these trees to undergo special experimental treatment to make them grow faster. The heights of these trees, in cm, are as follows:

QUESTION 10

10.1

Construction: Draw diameter AOD and join DB

$$\hat{A}_1 + \hat{A}_2 = 90^\circ \quad [\text{tangent} \perp \text{radius}]$$

$$\hat{B}_1 + \hat{B}_2 = 90^\circ \quad [\angle \text{ in a semicircle}]$$

But: $\hat{A}_2 = \hat{B}_1$ $[\angle \text{ s in the same segment}]$

$$\therefore \hat{A}_1 = \hat{B}_2$$

$$\text{or } \hat{CAP} = \hat{ABC}$$

OR

Construction: Draw radii CO and AO.

$$\hat{A}_1 + \hat{A}_2 = 90^\circ \quad \text{or} \quad \hat{A}_1 = 90^\circ - \hat{A}_2 \quad [\text{tangent} \perp \text{radius}]$$

$$\hat{A}_2 = \hat{C}_1 \quad [\angle \text{ s opp. equal sides}]$$

$$\hat{AOC} = 180^\circ - 2\hat{A}_2 \quad [\text{sum of } \angle \text{ s of } \Delta]$$

$$\therefore \hat{ABC} = 90^\circ - \hat{A}_2 \quad [\angle \text{ at centre} = 2 \times \angle \text{ at circumference}]$$

$$\therefore \hat{ABC} = \hat{A}_1$$
