GEOMETRY OF STRAIGHT LINES

NAMING LINES AND ANGLES

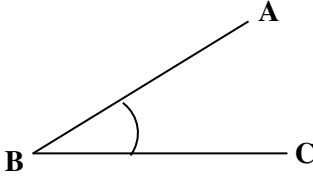

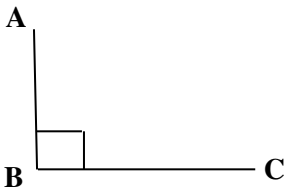

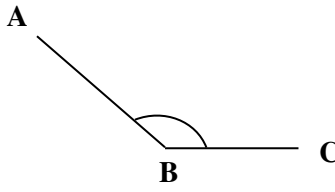

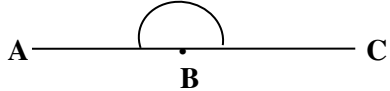

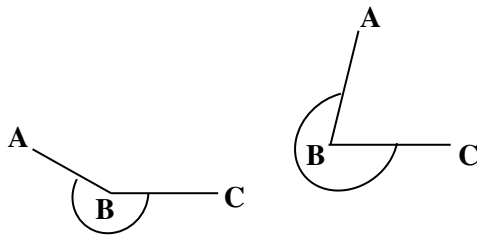

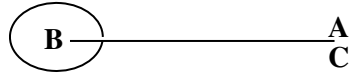

The line segments which join together at the vertex to form an angle are known as arms.

THE THREE WAYS IN WHICH ANGLES BETWEEN ARMS ARE LABELLED ARE SHOWN

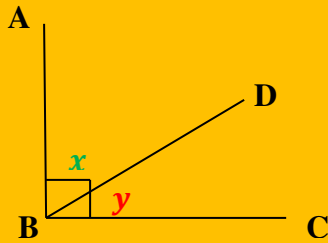

Using a single letter	Using the letters of the arm	Using subscripts
The angle between arm AB and BC is labelled as: $\hat{B}$	The angle between arm AB and BC is labelled as: $\hat{ABC}$	The angle between arm AB and BC is labelled as: $\hat{B}_2$ The angle between arm AB and BD is labelled as: $\hat{B}_1$ $\hat{B}_2 = \hat{ABC}$ and $\hat{B}_1 = \hat{ABD}$

NAMES OF ANGLES

Name of Angle	Diagram	Size of Angle
Acute Angle		An acute angle is greater than 0° but less than 90° . $0^\circ < \hat{B} < 90^\circ$
Right Angle		A right angle is equal to 90° . Arm AB is perpendicular to BC. This is written as $AB \perp BC$. $\hat{B} = 90^\circ$
Obtuse Angle		An obtuse angle is greater than 90° but less than 180° . $90^\circ < \hat{B} < 180^\circ$
Straight Angle		A straight angle is equal to 180° . $\hat{B} = 180^\circ$
Reflex Angle		A reflex is greater than 180° but less than 360° . $180^\circ < \hat{B} < 360^\circ$
Revolution		A revolution is equal to 360° . $\hat{B} = 360^\circ$

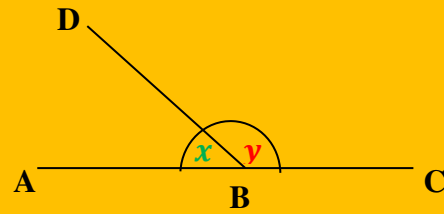

COMPLEMENTARY AND SUPPLEMENTARY ANGLES

Complementary angles add up to 90° Supplementary angles add up to 180°

In the above diagram: $x + y = 90^\circ$

Reason: comp $\angle$'s

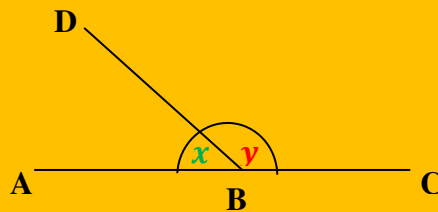

In the above diagram: $x + y = 180^\circ$

PROPERTIES OF STRAIGHT LINES

ADJACENT ANGLES ON A STRAIGHT LINE

Adjacent angles on a straight line are supplementary.
