5.2 $n(\text{CaCO}_3) = 0,12 \text{ mol}$
 $n(\text{HCl}) = c \times V$
 $= 3 \times 0,2 \checkmark$
 $= 0,6 \text{ mol} \checkmark$
 $\text{CaCO}_3 : \text{HCl}$
 $1 : 2$
 $0,12 : 0,24 \checkmark$
 $0,24 < 0,6 \quad \text{HCl is in excess/ oormaat} \checkmark$ (4)

5.3 4 minutes has a higher rate $\checkmark$ than 8 minutes
4 minute het 'n hoër reaksietempo $\checkmark$ as 8 minute (1)

5.4 As the reaction proceeds, the concentration of the HCl decreases. $\checkmark$
 This means fewer particles per volume. $\checkmark$
Fewer effective collisions per unit time. $\checkmark$
 Which results in a lower rate of reaction at 8 minutes
Soos reaksie verloop, neem die HCl konsentrasie af $\checkmark$
Dit beteken minder deeltjies per volume $\checkmark$
Minder effektiewe botsings per tyds eenheid $\checkmark$
Dus 'n laer reaksie tempo by 8 minute (3)

5.5 3,25 g $\checkmark$ (1)

Eksotermies ✓

(1)

- 6.1.6 Rates of both forward and reverse reactions decrease.
Reverse reaction rate decreases more. ✓
Rate of endothermic reaction will decrease more to absorb the energy.
Thus, the reverse reaction is endothermic. ✓
Forward reaction was (increased) favoured by the decreases in temperature.

*Die tempo van beide die voorwaartse en terugwaartse reaksies neem af
Die terugwaartse reaksie tempo neem meer af ✓
Die tempo van die endotermiese reaksie sal meer afneem omdat die energie te absorber (Volgens Le Chatelier se beginsel sal temperatuur verhoging die endotermiese reaksie bevoordeel)
Dus die terugwaartse reaksie is endotermies ✓
Die voorwaartse reaksie is bevoordeel deur die afname in temperatuur*

(2)

6.1.7 K_c will increase. ✓

Since $K_c = \frac{[NO]^2}{[N_2][O_2]}$ and the forward reaction is favoured, it will cause an increase in [NO]✓, value of K_c will increase.

OR

Decrease in the [N₂] and [O₂] ✓, value of K_c will increase.
